

CMS Admin — User Guide

Everything you can do in the admin dashboard, explained in plain language: writing and publishing articles, managing media and categories, discovering news, and running your team.

1. Logging in

Your gateway to the dashboard. Everything except this screen requires a valid login.

- Enter your **email** and **password** on the login screen.
- Your session is remembered in the browser, so you stay logged in between visits.
- If your session expires or you sign out, you're returned to the login screen automatically.
- Use the **Logout** button in the top-right header at any time.

Roles matter. What you can see and change depends on your role — Admin, Editor, or Author. Only Admins can manage users and global settings.

2. Dashboard (Home)

Your landing page — a quick health-check of the publication.

- At-a-glance **stat cards**: total articles, number of authors, and total views.
- A **recent activity** area summarising what's been happening.
- Think of it as the cockpit — start here, then jump into Articles or Discovery.

3. Articles list

The control center for everything you've written — find, filter, and manage every article.

Finding articles

- **Search** by headline.
- **Filter by status**: All, Published, Scheduled, Draft, or Unpublished.
- **Filter by date**: last 7 / 15 / 30 / 90 days, or a custom range.
- **Filter by category** and by **tags**.

Actions on each article

- **Edit** — open it in the editor (for anything not yet published).

- **Publish now** — push a draft live immediately.
- **Unpublish** — pull a live article back off the site.
- **Reschedule / change date** — move a scheduled article to a different time.

Destructive actions (like unpublishing) ask for confirmation first, so you won't accidentally take something offline.

4. Article editor

A full word-processor-style writing tool. This is where the actual content is created.

The basics

- **Headline** and **body** — the title and the article text.
- **Featured image** — drag and drop an image; it's automatically compressed so pages stay fast. You can add a caption.
- **Category** — pick one (e.g. Funding, AI, Startups).
- **Tags** — add as many as you like; type to get suggestions, shown as removable pills.
- **Publish date** — choose now, or a future date/time (which automatically schedules it).

Rich formatting

- Bold, italic, underline, strikethrough.
- Text colors (palette + custom picker), highlights, dozens of fonts and sizes.
- Headings, bullet/numbered lists, checklists, text alignment.
- Links, embedded **YouTube** videos, tables, and callout blocks.
- Insert and **resize images inline**, with left/center/right alignment and captions.
- Fine typography: line spacing, letter spacing, paragraph spacing, drop caps.

Auto-save. Your work saves itself as you type. A small dot shows the status — green = saved, amber = saving — along with the last-saved time. No "lost my work" surprises.

5. Publishing workflow

Every article moves through a simple set of states. This determines whether it shows on the public website.

Draft → Scheduled → Published → Unpublished

State	Meaning	On public site?
-------	---------	-----------------

Draft	Work in progress, not finished.	No
Scheduled	Finished, set to go live at a future date/time.	No (until that time)
Published	Live and visible to readers.	Yes
Unpublished	Was live, then pulled back off.	No

The #1 thing to remember: only **Published** articles appear on the public portal. If something is missing from the website, check it isn't still a Draft or Scheduled.

6. Media library

A central home for all your images.

- **Upload** new images — automatically compressed for fast page loads.
- Browse everything in a **gallery grid**, with **search**.
- **Delete** images you no longer need (hover to reveal the option).
- Images uploaded while editing an article are automatically added here too.

7. Categories & tags (Taxonomy)

How your content is organised and filtered.

- **Categories** — the main buckets (Funding, AI, Startups...). Each has a name, an auto-generated web-friendly slug, and a description.
- **Tags** — finer-grained labels you can attach freely to articles.
- Create, rename, and delete both from a clean two-panel screen.

Categories and tags created here are the same ones you choose from inside the article editor.

8. Navigation menu

Controls the menu shown in the public website's header.

- Add menu items with a **label** and a **link**.
- **Drag and drop** to reorder items.

- Create **nested** (parent → child) dropdown menus.

9. Discovery — RSS intelligence

A news-radar that pulls in stories from across the web so you never miss what's happening.

What it does

- Pulls articles from **RSS sources** you manage (add or remove feeds).
- Shows them in a grid or list you can browse and page through.
- **Sync controls**: a quick sync (~seconds) or a full rescan, with a live progress bar and timer.

Filtering the firehose

- **Signals** — startup themes like Funding, Acquisition, Shutdown, Layoffs, Product Launch, Founder Story (21 types).
- **Industries** — verticals like Fintech, EdTech, AI/ML, HealthTech, Web3 (25+).
- **Time windows** — last 24h, 48h, 7d, 15d, 3 months, or custom.
- **Bookmark** stories to revisit, and filter to bookmarked-only.

"Inject". Found a story worth covering? Send it straight into the article editor as a starting point — no copy-pasting.

10. AI Studio

An AI writing assistant for transforming and polishing text.

- Choose an AI model (OpenAI's GPT-4o or Google's Gemini).
- One-click actions: **rewrite professionally**, **summarise for news**, **optimise for SEO**, **rewrite for social media**, or a **custom prompt**.
- See how much the text changed, then copy the result into your article.

11. Contact messages

An inbox for messages submitted through the website's contact form.

- Read incoming messages in a list, with **search**.
- Mark as **read / unread** and **delete**.
- The list **refreshes automatically**, so new messages appear without reloading.

12. Users & roles (Admin only)

Manage who's on your team and what they're allowed to do.

- **Invite** a teammate: email, name, a starting password, role, and job title.
- See everyone with their avatar, role, and active/disabled status.
- **Enable/disable** or **remove** accounts.

Role	Typical access
Admin	Everything, including users & global settings.
Editor	Create, edit, and publish content.
Author	Write and manage their own content.

13. Settings (Admin only)

Site-wide configuration that affects the public website.

- **Logo** — paste a URL or upload an image.
- **Social links** — Twitter, LinkedIn, Instagram.
- **Legal/info pages** — About Us, Terms & Conditions, Privacy Policy text.

14. Architecture / site map

A visual overview of all the pages on the public website — both fixed pages and live article routes — handy for understanding the whole site at a glance.
